## PERSONAL INFORMATION

---

- Female; U.S. citizen

## EDUCATION

---

Ph.D. in Finance - Department of Finance, University of Florida - Gainesville	8/2003 - 7/2008
Master of Science in Mathematics - Department of Mathematics, University of Florida - Gainesville	8/2001 - 5/2003
Bachelor of Science in Mathematics - Department of Mathematics, Fudan University	9/1997 - 6/2001

## RESEARCH INTERESTS

---

Empirical Corporate Finance; Theoretical and Empirical Asset Pricing; Behavioral Finance; Entrepreneurship; International Finance

## ACADEMIC POSITIONS

---

1. Associate Professor of Finance (Research), Fox School of Business, Temple University, August 2018 –
2. Assistant Academic Director of the Doctor of Science in Global Finance (DS-GF) program (joint program with Tsinghua University)
3. Visiting Assistant Professor of Finance, University of Maryland, College Park, August 2013 – June 2018
4. Assistant Professor of Finance, Faculty of Business and Economics, the University of Hong Kong, August 2008 – 2013

## RESEARCH

---

### Publications

1. [Recovery with Applications to Forecasting Equity Disaster Probability and Testing the Spanning Hypothesis in the Treasury Market](#). Accepted at *Journal of Financial and Quantitative Analysis* (with Gurdip Bakshi and Jinming Xue).

We investigate the implications of recovering real-world conditional expectation of return functions using options on the S&P 500 index and Treasury bond futures. First, we construct estimates of the probability of disasters, defined as higher than 6%, 5%, or 4% equity market declines over option expiration cycles. This measure of disaster probability forecasts realized disasters. Second, we employ options on the futures of the 10- and 30-year Treasury bonds to construct estimates for the expected return of bond futures. These measures display forecasting ability for subsequent futures returns beyond the level, slope, and curvature variables extracted from the yield curve.

2. [Decoding Default Risk: A Review of Modeling Approaches, Findings, and Estimation Methods](#) (with Gurdip Bakshi and Zhaodong Zhong), October 2021, Prepared for *Annual Review of Financial Economics*.

Default risk permeates the behavior of corporate bond returns and spreads, credit default swap spreads, estimation of default probabilities, and loss in default. Pertinent to this review are salient empirical findings

and implications of default process estimations over 1974 to 2021. Both structural and reduced-form models are covered. In structural models, there is default if the value of assets falls below some threshold obligation. The reduced-form models involve assumptions about the default process combined with recovery in default. Default process estimations and measurements of default probability have improved by exploiting data on defaultable bonds, credit default swaps, tally of default realizations, and options on individual equities. Empirical investigations continue to address the relevance of stochastic asset volatility, jumps in asset values, and modeling of default boundary and firm leverage process.

3. [A Theory of Dissimilarity Between Stochastic Discount Factors](#), *Management Science* 67 (7), 2021, 4602-4622, (with Gurdip Bakshi and George Panayotov)

This paper proposes a measure of dissimilarity between stochastic discount factors (SDFs) in different economies. The SDFs are made comparable using the respective bond prices as the numeraire. The measure is dimensionless, synthesizes features of the risk-neutral moments of excess currency returns, and can be extracted from currency option prices. Linking theory to data, we provide evidence gathered from (i) the cross-section of 45 currency option prices, (ii) the time-series of currency returns, (iii) estimated SDFs using model-free restrictions, and (iv) structural models in international finance.

4. [Understanding the Sources of Risk Underlying the Cross-Section of Commodity Returns](#), *Management Science*, 65 (2), 2019, 619-641, (with Gurdip Bakshi and Alberto Rossi).

We show that a model featuring an average commodity factor, a carry factor, and a momentum factor is capable of describing the cross-sectional variation of commodity returns. More parsimonious one- and two-factor models that feature only the average and/or carry factors are rejected. To provide an economic interpretation, we show that innovations in global equity volatility can price portfolios formed on carry, while innovations in a commodity-based measure of speculative activity can price portfolios formed on momentum. Finally, we characterize the relation between the factors and the investment opportunity set.

5. [A Recovery That We Can Trust? Deducing and Testing the Restrictions of the Recovery Theorem](#), *Review of Financial Studies* 31(2), 2018, 532-555, (with Gurdip Bakshi and Fousseni Chabi-Yo).

How reliable is the recovery theorem of Ross (2015)? We explore this question in the context of options on the 30-year Treasury bond futures, allowing us to deduce restrictions that link the physical and risk-neutral return distributions. Our empirical results undermine the implications of the recovery theorem. First, we reject an implicit assumption of the recovery theorem that the martingale component of the stochastic discount factor is identical to unity. Second, we consider the restrictions between the physical and risk-neutral return moments when the recovery theorem holds, and reject them in both forecasting regressions and generalized method of moment estimations.

6. [Do Individual Investors Treat Trading as a Fun and Exciting Gambling Activity? Evidence from Repeated Natural Experiments](#), *Review of Financial Studies* 28 (2015), 2128-2166 (with Tse-Chun Lin).

We hypothesize that individual investors treat trading as a fun and exciting gambling activity, implying substitution between this activity and alternative gambling opportunities. To examine this hypothesis, we study the lottery jackpots and the trading of individual investors in Taiwan. When the jackpots exceed 500 million Taiwan dollars, the trading volume decreases between 5.2% and 9.1% among stocks preferred by individual investors and between 6.8% and 8.6% among lottery-like stocks. The decline in individual buy volume is statistically indistinct from the decline in sell volume. Large jackpots are associated with less trading in options with high sensitivity to volatility.

7. [Where Have All the IPOs Gone?](#) *Journal of Financial and Quantitative Analysis* 48 (2013), 1663-1692 (with Jay Ritter and Zhongyan Zhu). [awarded the 2013 JFQA William F. Sharpe Award]

[This paper is also the basis of the [Testimony of Jay Ritter before the Senate Committee on Banking, Housing, and Urban Affairs, March 6th 2012](#)].

During 1980–2000, an average of 310 companies per year went public in the United States. Since 2000, the average has been only 99 initial public offerings (IPOs) per year, with the drop especially precipitous among small firms. Many have blamed the Sarbanes-Oxley Act of 2002 and the 2003 Global Settlement’s effects on analyst coverage for the decline in IPO activity. We find very little support for the conventional wisdom, and we offer an alternative explanation. Our economies of scope hypothesis posits that the advantages of selling out to a larger organization, which can speed a product to market and realize economies of scope, have increased relative to the benefits of operating as an independent firm.

8. [The Marketing of Seasoned Equity Offerings](#) (with Jay Ritter), *Journal of Financial Economics* 97 (2010), 33 - 52. [awarded the first prize of the 2010 JFE Jensen Prizes for Corporate Finance and Organizations].

In an accelerated seasoned equity offering (SEO), an issuer foregoes the investment bank’s marketing efforts in return for a lower fee. To explain why many issuing firms choose a higher cost fully marketed offer, we posit that the marketing effort flattens the issuer’s shortrun demand curve. Alternatively stated, with a fully marketed offer, the issuer is paying investment bankers to create demand, making the elasticity of demand at the time of issuance an endogenous choice variable. Empirical analysis shows that both the pre-issue elasticity of the issuing firm’s demand curve and the offer size are important determinants of the offer method choice. We find evidence of a large transitory increase in the elasticity of demand for issuers conducting fully marketed SEOs.

## Working Papers

1. [The Puzzle of Treasury Option Returns and the Consistent Pricing of Options and the Yield Curve](#) Revise and Resubmit at *Review of Financial Studies* (with Gurdip Bakshi and John Crosby, 2021, presented at AFA 2020 in San Diego, presented at MFA 2019 in Chicago).

We formalize the notion of local time risk premium in the context of a theory in which the pricing kernel is a general diffusion process with spanned and unspanned components. We derive results on the expected excess return of options on bond futures. These results are organized around our new empirical finding that the average returns of out-of-the-money puts and calls on Treasury bond futures are both negative. Our theoretical reconciliation warrants a negative local time risk premium, and our treatment considers models with market incompleteness and sources of volatility uncertainty.

2. [Dark Matter in \(Volatility and\) Equity Option Risk Premiums](#) Revise and Resubmit (Revision completed) at *Operations Research* (with Gurdip Bakshi and John Crosby, 2021, presented at Eastern Finance Association 2021, Midwest Finance Association 2021, Canadian Derivatives Association Conference 2020)

If the evolution of equity index volatility and the pricing kernel were to be absent of risks unspanned by index futures, it would counterfactually imply that (i) the expected excess return of out-of-the-money calls on futures is positive, (ii) the expected excess return of straddles is approximately zero, and (iii) futures returns and changes in volatility are perfectly correlated. Remedying these contradictions, we consider a specification of market incompleteness that equips the pricing kernel and volatility dynamics with unspanned risks. The empirical evidence is supportive of our theory of economically relevant unspanned risks.

3. [Negative Correlation Condition and the Dark Matter Property of Asset Pricing Models](#) (with Gurdip Bakshi, John Crosby, and Wei Zhou, 2021, presented at Virtual Derivatives Workshop 2021)

The negative correlation condition (NCC) of Martin (2017) is that  $\text{cov}^{\text{P}_t}(M_T * R_T, R_T) \leq 0$  for all  $M_T$ , where  $M_T$  is the SDF and  $R_T$  is the gross market return. He employs this assumption to derive a lower bound of the equity premium. This paper exploits theoretical and empirical constructions to refute the hypothesis of the NCC. Using options on the S&P 500 index and STOXX 50 equity index, the bootstrap-based tests favor rejection. Our empirical counterexamples of  $M_T$  contradict the universality of the NCC, exhibit variance-dependence and incorporate an increasing region to the return upside.

4. Implications of a General Formula for the Expected Excess Return of the Market (with Gurdip Bakshi, John Crosby, and Wei Zhou, 2021; this is a substantially revised version of the paper previously titled "A New Formula for the Expected Excess Return of the Market")

We derive a general formulation for the conditional expected excess return of the market that is robust to specifications of the SDF projection. In our approach, the conditional expected excess return of the market is adapted to the information in the risk-neutral return central moments. We examine the empirical implications of our approach using data on options on the S&P 500 equity index and other international indexes.

5. [The Geography of Exchange Rate Disconnect](#) (with Gurdip Bakshi and John Crosby, 2021, scheduled presentation at Midwest Finance Association 2022, presented at Eastern Finance Association 2021)

This paper proposes a measure of exchange rate disconnect. Working in a two-currency international economy, our theory implies that the disconnect is the ratio of two martingales. We analyze empirically our measure of disconnect using 435 pairs of economies to reveal a geography of disconnect. Linking theory to returns of international bonds and equities, we examine cross-sectional disparities in disconnect with respect to multidimensional attributes of the global economy, including volatility of extracted SDFs, volatility of exchange rate growth, (absolute) currency excess returns, trade patterns, and geographical proximity.

6. [Volatility Uncertainty, Disasters, and the Puzzle of VIX Futures Contango](#) (with Gurdip Bakshi, John Crosby, and Jinming Xue, revised December 2021).

The VIX futures curve is most often in contango but displays backwardation during unfavorable market conditions. We construct an explanation based on the notion of stochastic orders of volatility uncertainty – meaning that investors view short-dated volatility uncertainty as being less likely to take on larger values than long-dated volatility uncertainty – under all pricing measures. We complement this theory with tractable equity price processes, whose paths consist of continuous shocks interspersed with jump discontinuities, the latter reflecting disaster uncertainty with time-varying disaster probability.

7. [Madam Yellen Is Right about Minimum Wage Policies: Evidence from Millions of Sole Proprietors](#) (First draft 2018, being revised).

During her nomination hearing, Janet Yellen repeatedly defended the benefits of a higher minimum wage (Question 66 and follow-up). This study empirically investigates the question posed: How do minimum wage policies impact the profitability of sole proprietors? Utilizing a data set consisting of 430 million sole proprietors' reported net income with the IRS from 2004 to 2018, I examine a panel regression framework with all counties and continuous border county-pairs, as well as a difference-in-differences approach. In each identification strategy, minimum wage hikes are linked to higher net income among sole proprietors. The estimated elasticity ranges between 0.15 and 0.20.

8. [Caution under Ambiguity and Blowups](#) (with Gurdip Bakshi and John Crosby, Revised April 2021, presented at Eastern Finance Association 2021, presented at European Finance Association 2018).

We develop an axiomatically consistent way of ranking and scoring actively managed funds and investment strategies. Our performance measure accounts for the feature that investors may exhibit caution, via the mechanism of ambiguity aversion, when evaluating investment strategies. Linking developed theory to data, we feature evidence on a real-world question: Do investors gain by selling the tails of return distributions? Using data on options on (i) the S&P 500 equity index, and (ii) Treasury bond futures, our answer to this question is in the negative. We complement our evidence from options on STOXX 50, FTSE, and Nikkei equity indexes.

9. [The Scourge of Pandemics and Risk Premium](#) (with Gurdip Bakshi, 2020)

Pandemics pressure vulnerabilities in the ecosystem of societies, including corporate profitability. This paper seeks an answer to an unresolved question: What could be the risk premium for pandemics? We present a framework to derive expressions for equity price and risk premium and then consider an approach to identify risk premium for pandemics that is data-informed. Bridging theory and investment practice, our implementations indicate that the estimate of pandemic risk premium is 2.55% over 01/1871 to 12/2019 (149 years). We benchmark the risk premium for pandemics to those for wars and Great Depression.

10. [The Bond Risk Premium Channel of Monetary Policy: Reconciling the Moving Parts in the FOMC Announcement Effects](#) (with Gurdip Bakshi and Fousseni Chabi-Yo, 2020).

Bond risk premiums undergo a realignment around FOMC announcement. We construct daily conditional risk premiums on the long-term bond (and equity) using options on Treasury bond futures to examine hypotheses about FOMC announcement effects. Connecting theory to extracted risk premiums and tail risks, we provide evidence that (i) bond and equity risk premiums rise on pre-announcement day, but fall on announcement day, (ii) FOMC announcement recalibrates bond and equity tail risks, and (iii) bedrock relations between equity returns, risk premiums, and market uncertainty behave anomalously preannouncement (and alludes to leakage). We formalize a theory that synthesizes bond risk premiums.

11. [Measuring and Understanding Uncertainty of Uncertainty](#) (with Jinming Xue, under revision).

Uncertainty of uncertainty characterizes the dispersion of the cost of insuring equities. We propose a methodology that measures and extracts uncertainty of uncertainty from options on the VIX futures. Uncertainty of uncertainty is high, variable, and not highly correlated with extant uncertainty indexes. Exploring its macroeconomic origins in the setting of a large macroeconomic data set, we find that uncertainty of uncertainty can be forecast by principal components that echo concerns about monetary policy outcomes, flight to safety, and deflation. We draw inferences about the predictive coefficients based on a number of statistical tests, including a parametric bootstrap procedure.
